# About Geoscience Australia and Digital Earth Australia

# What problems are we trying to solve?

## Unlocking potential with Geoscience Australia

Geoscience Australia is a complex organisation with a huge amount of valuable data and science.

Geoscience Australia is facing many challenges. Information is difficult to discover and access, audiences have highly complex requirements and the organisation lacks a public profile.

This piece of work, developed by Today, outlines a human-centred design approach to solving these challenges.

The design process began with getting a deep understanding of Geoscience Australia. This was followed by in-depth user research involving Geoscience Australia stakeholders, a diverse set of practitioners from different scientific disciplines, as well as the general public.

This artefact outlines 20 recommendations for your organisation.

There is an enormous opportunity to use the high-impact, quality scientific data collected by Geoscience Australia to help institutions, academia, industry and the general public to model the future and solve some of society's biggest challenges.

### The challenge

How do the general public and stakeholders currently engage with Geoscience Australia's services, and how might they in the future?

### Who we spoke to

#### Digital deep dive

Today performed a deep dive into Geoscience Australia's core digital capability. This was conducted through a series of interviews with key stakeholders, including senior executives, digital leaders, and those responsible for data and digital assets.

#### User engagement

Today explored the value and application of Geoscience Australia's core digital capability. This included a series of interviews with key stakeholders, including senior executives, digital leaders, and those responsible for data and digital assets.

#### Internal engagement

Today explored the value and application of Geoscience Australia's core digital capability. This included a series of interviews with key stakeholders, including senior executives, digital leaders, and those responsible for data and digital assets.

#### Regular feedback

Today explored the value and application of Geoscience Australia's core digital capability. This included a series of interviews with key stakeholders, including senior executives, digital leaders, and those responsible for data and digital assets.

## What we heard

There are key challenges identified for Geoscience Australia that make it's role ambiguous and hamper our ability to access users and respond to their needs.

### Difficult to discover and access

The experience of interacting with Geoscience Australia is complex and often across multiple channels. This is evident in the variety, but also across all interactions, organisational, and the broad, organisational descriptions and purposes.

**Insights**

- It is difficult to distinguish between Geoscience Australia's role and the public's role in the broader scientific community.
- There is a lack of clarity around the role of Geoscience Australia in the public's mind.
- Geoscience Australia's role is often seen as ambiguous and unclear.
- Geoscience Australia's role is often seen as being too broad and not specific enough.
- Geoscience Australia's role is often seen as being too technical and not accessible enough.

### Latent potential, unmet needs

There are many unmet needs for Geoscience Australia in the market and in the public. The public most want of everything, particularly the ability to access and use the data and science that Geoscience Australia has collected. This is evident in the variety, but also across all interactions, organisational, and the broad, organisational descriptions and purposes.

**Insights**

- Geoscience Australia has a lot of potential to do more for the public and the market.
- Geoscience Australia has a lot of potential to do more for the public and the market.
- Geoscience Australia has a lot of potential to do more for the public and the market.
- Geoscience Australia has a lot of potential to do more for the public and the market.
- Geoscience Australia has a lot of potential to do more for the public and the market.

### Largely unknown, but trusted

Geoscience Australia is not a household name. Many people are aware of its role, but they are not sure what it is or what it does. However, they do trust the organisation and its data.

**Insights**

- Geoscience Australia is not a household name.
- Many people are aware of its role, but they are not sure what it is or what it does.
- However, they do trust the organisation and its data.
- Geoscience Australia is not a household name.
- Many people are aware of its role, but they are not sure what it is or what it does.

### User needs are complex and diverse

Geoscience Australia has a very diverse set of users with very different needs. These needs are complex and diverse, and they are not always met by the organisation. This is evident in the variety, but also across all interactions, organisational, and the broad, organisational descriptions and purposes.

**Insights**

- Geoscience Australia has a very diverse set of users with very different needs.
- These needs are complex and diverse, and they are not always met by the organisation.
- This is evident in the variety, but also across all interactions, organisational, and the broad, organisational descriptions and purposes.
- Geoscience Australia has a very diverse set of users with very different needs.
- These needs are complex and diverse, and they are not always met by the organisation.

"Geoscience Australia is an organisation that's playing a critical role in the welfare of the earth"  
— member of the general public

### Data and technology are forever evolving

The way science is being created and digested, along with major changes to sensors, technology and data, has a large impact on how science is applied.

**Insights**

- The way science is being created and digested, along with major changes to sensors, technology and data, has a large impact on how science is applied.
- The way science is being created and digested, along with major changes to sensors, technology and data, has a large impact on how science is applied.
- The way science is being created and digested, along with major changes to sensors, technology and data, has a large impact on how science is applied.
- The way science is being created and digested, along with major changes to sensors, technology and data, has a large impact on how science is applied.
- The way science is being created and digested, along with major changes to sensors, technology and data, has a large impact on how science is applied.

### A demand for leadership

General public and industry stakeholders held Geoscience Australia in a high regard. They saw the organisation as a leader in the field of geoscience and as a provider of high-quality data and science. This is evident in the variety, but also across all interactions, organisational, and the broad, organisational descriptions and purposes.

**Insights**

- General public and industry stakeholders held Geoscience Australia in a high regard.
- They saw the organisation as a leader in the field of geoscience and as a provider of high-quality data and science.
- This is evident in the variety, but also across all interactions, organisational, and the broad, organisational descriptions and purposes.
- General public and industry stakeholders held Geoscience Australia in a high regard.
- They saw the organisation as a leader in the field of geoscience and as a provider of high-quality data and science.

## Design principles

The following principles were generated by Today after synthesising the research findings to develop the next set of recommendations.

Use them to inspire new ideas, prioritise initiatives and create strategic focus.

**Put our users at the centre of everything**

**Understand differences to design for everyone**

**Make our data discoverable and accessible**

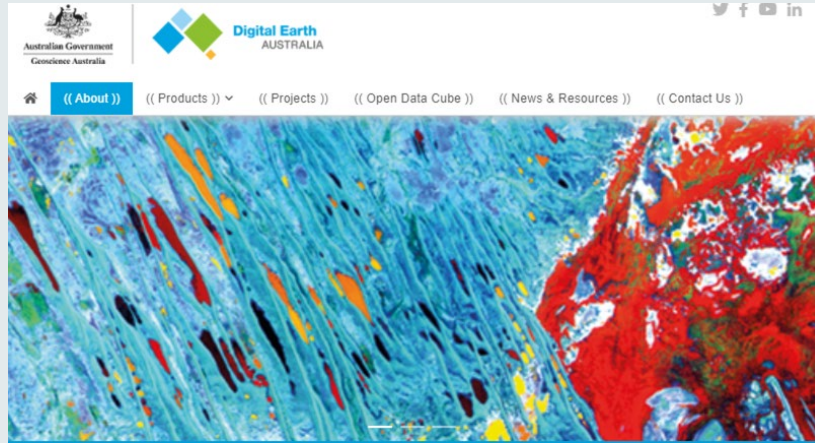

**Be a leader and have a clear voice**

**Share widely and collaborate effectively**

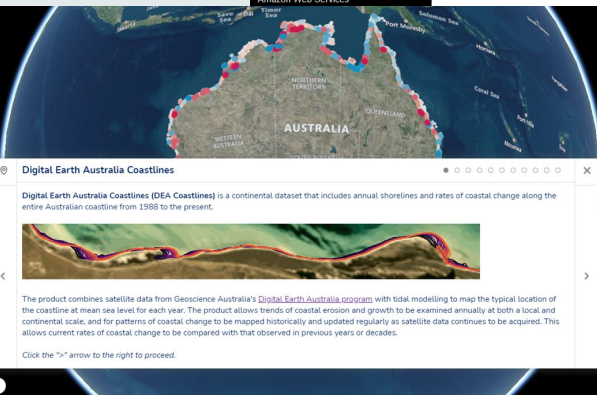

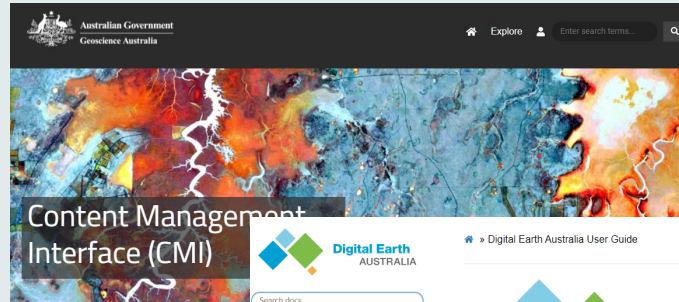

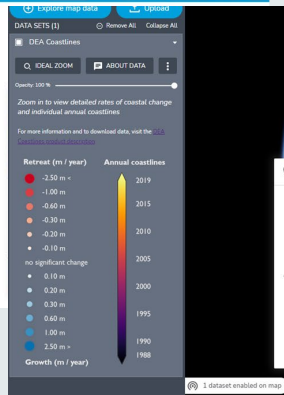

# Why Digital Earth Australia as a pilot project?

About

Products

is platform for satellite imagery and other Earth observations.

ect, see <http://www.ga.gov.au/dea>

in beta for users with accounts on the National Computational Earth Australia Sandbox (see the [Setup introduction](#) page).

ective [Digital Earth Australia Maps](#) platform, or accessed directly

g WMS, WCS and some WPS functionality is

# User centred experience

# Why user centred experience?

## Desirability

- Design and deliver what people need and value
- Reduce frustration, increase positive perceptions and interactions

## Viability

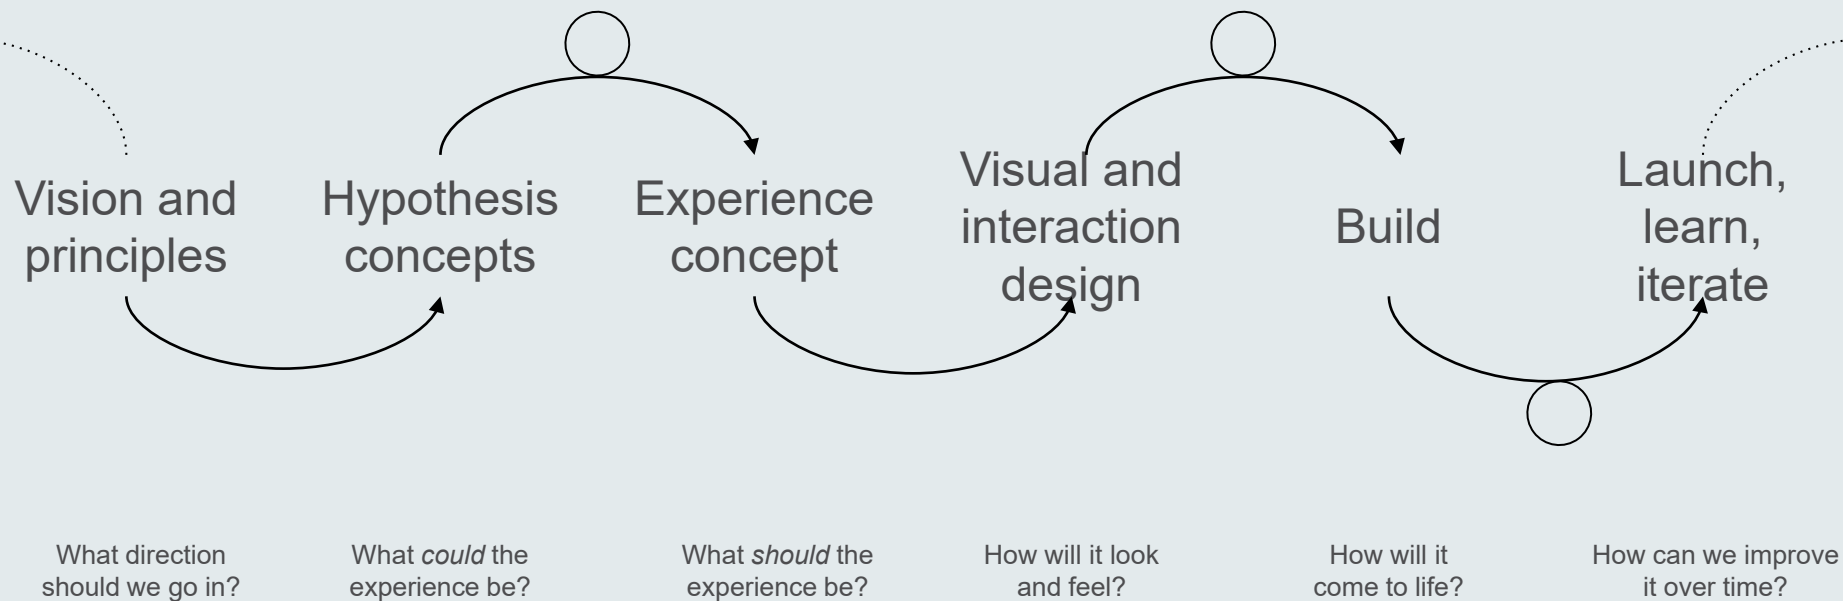

- Prioritise money and effort on what people need and value

## Feasibility

- Make technology decisions which will support users now and in the future

# Designing a user-centred experience

# How did we do it?

## Phase 1: UX and prototyping

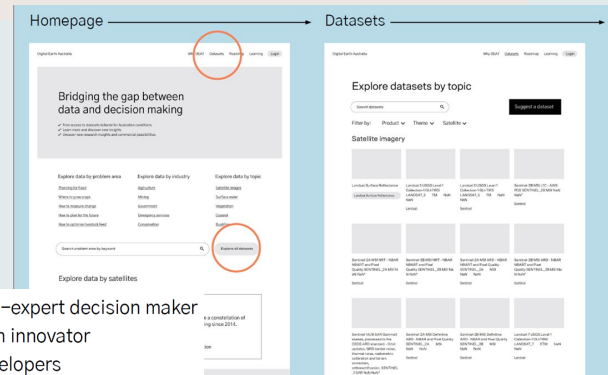

"Case studies are the bridge between the real academic information into something they can pick up and use, even if they're not already in that science"

—GOV6

"<It's> giving people more information...making it more accessible for people to find this information...about the earth"

—GEN8

1. Non-expert decision maker
2. Tech innovator
3. Developers
4. Advisors
5. Remote sensing community

## Phase 2: design and build

### Highlight Blocks

Three types of content blocks that can be used as a feature block to highlight either a case study, product or content with multiple information links. Always features an image which can appear on the right or left hand side.

### Desktop >990

#### Case Study Highlight Block

- Full width block
- Includes sub heading (display), heading (display), body copy, link and image
- Height of block varies depending on copy content
- Image to fill block height
- Option to change background gradient (color, text of gradient)
- Hover state over entire block

#### CHARACTER COUNT

Heading - Max 40 characters  
Body - Max 120 characters

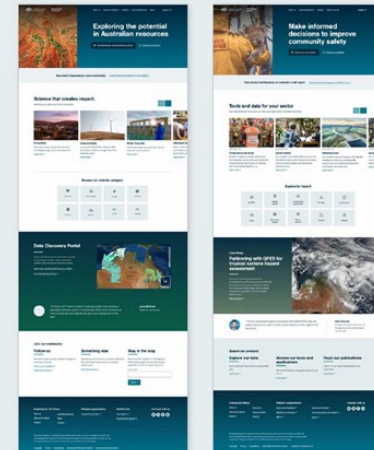

### Mobile >990

- Height of image is consistent when scaled to mobile  
- Image always sticks to top of content on mobile

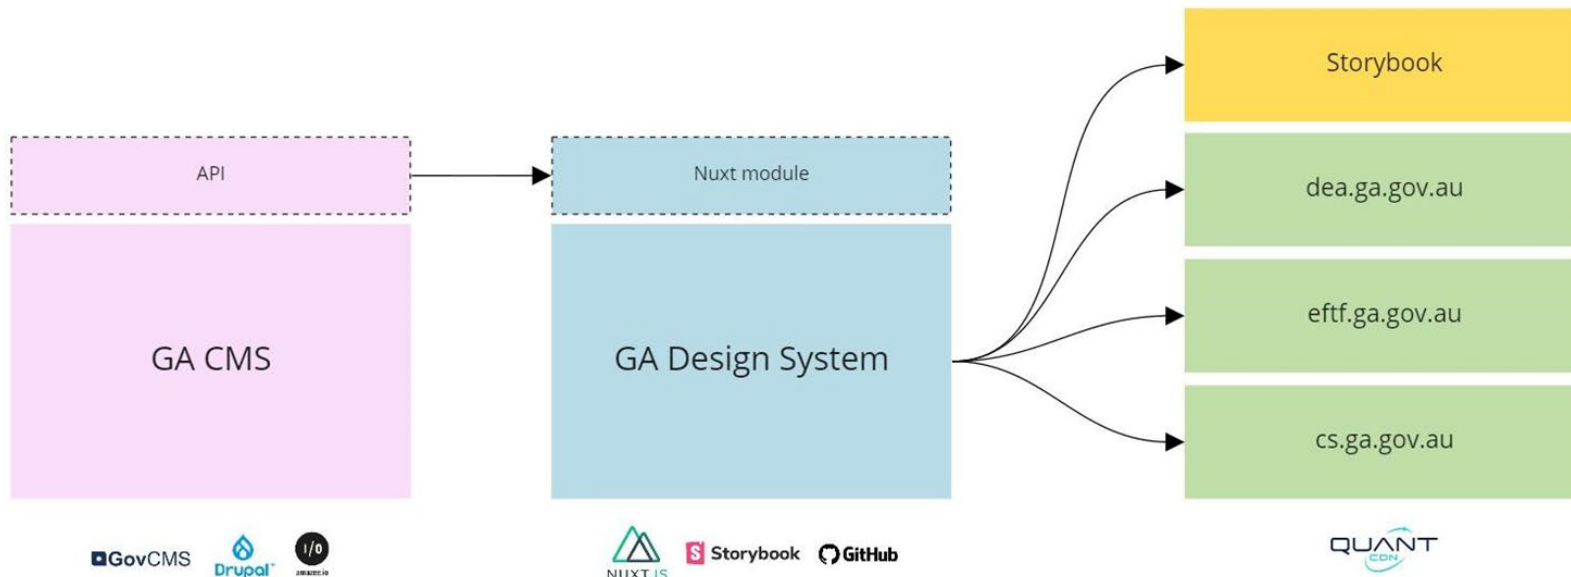

## New websites

# Design system

# Decoupled architecture

# A design system for Geoscience Australia

## What is a design system?

- A shared visual language at scale allowing the reusability of components and patterns

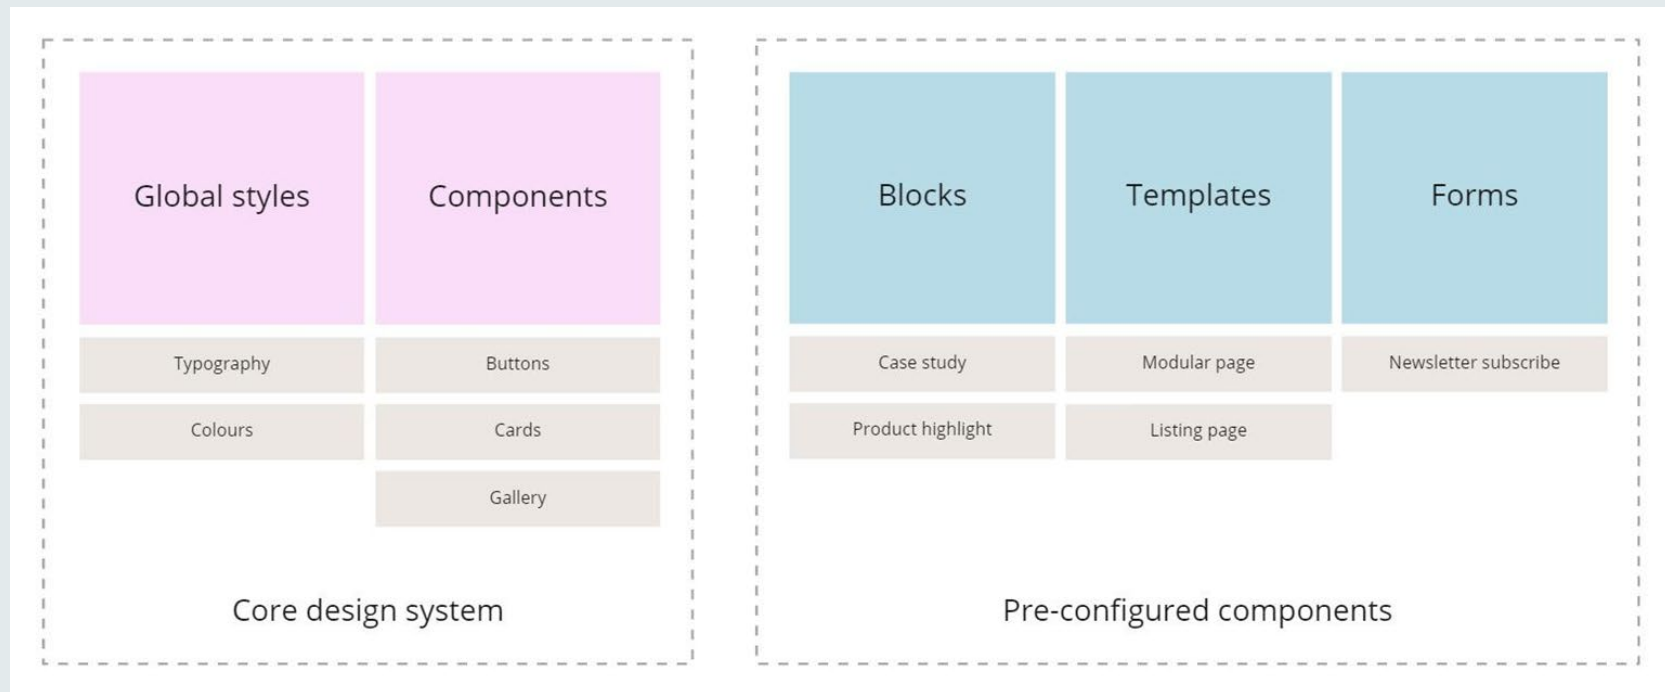

## Why use a design system?

- Consistency in user interface design
- New applications and websites can be developed rapidly

## How do you maintain it?

- A methodology or framework is required to organise your styles and components
- Every addition or update requires thoughtful consideration of impact to existing code and future iterations
- Separate the business logic from design logic for reusability
- Documentation through code

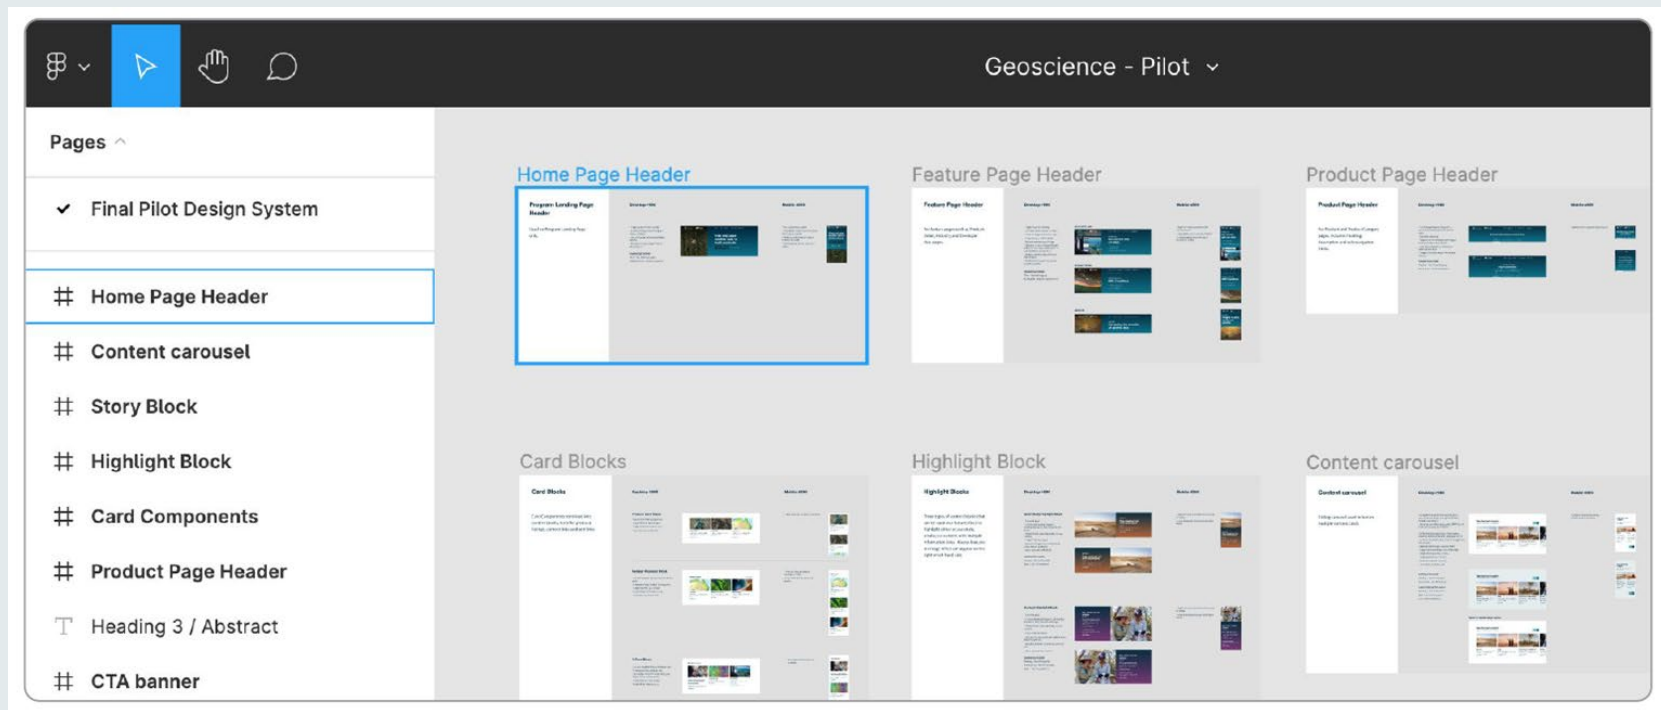

# Design system in code

Author: Laura E.R. Rocchio

## Beachcombers the world over marvel at how the beach grows and contracts with the tide. That beguiling strip of land that the low tide reveals, and the high tide conceals, is known as the intertidal zone.

This zone is a rich ecosystem, as anyone who has peered into tidal pools or chased crabs and searched for shells on tidal flats might guess. It provides habitat for migrating shorebirds and is a first line of defense against extreme storm events, but pressure is mounting on this zone from sea-level rise and anthropogenic sources such as land reclamation and aquaculture.

Land management requires land mapping, but surveying this ephemeral landscape has traditionally been difficult, especially when mapping large expanses of shoreline. Now a new and innovative mapping approach is changing that.

Using decades of Landsat data, a Geoscience Australia research team has created a continent-wide intertidal zone extent map for the whole of the Australian coast — more than 50,000 km. Using an automated workflow their analysis of Landsat data spanning from 1987–2013 has yielded a map product: [DEA Intertidal Extents](#) also known as the 'Intertidal Extents Model' (ITEM).

Updated: Annually | Satellite data from: Landsat | Data since: 1988 | Released: 2021

## See decades of coastal change

A groundbreaking data product, DEA Coastlines combines satellite data with tidal modelling to map the typical location of the Australian coastline at mean sea level for every year since 1988. Resulting shorelines and detailed rates of change show how beaches, sandspits, river mouths, and tidal flats have grown and eroded over time

# Nuxt JS

- ✓ Framework built on top of Vue.js
- ✓ Static site generation without a web server
- ✓ Performance and SEO benefits
- ✓ DruxtJS not used on this project but may be useful

Table of Contents >

## Static Site Generation

With static site generation you can render your application during the build phase and deploy it to any static hosting services such as Netlify, GitHub pages, Vercel etc. This means that no server is needed in order to deploy your application.

### Generating your site

When deploying your site in with `target:static` all your `.vue` pages will be generated into HTML and JavaScript files. All calls to APIs will be made and cached in a folder called static inside your generated content so that no calls to your API need to be made on client side navigation.

# Quant CDN

- ✓ Global CDN, 60+ regions
- ✓ Static and JAMstack
